# Confluence Plugins

About Plugins

Standard Confluence has minimal functionality out of the box. Confluence administrators customize it by adding plugins from the Atlassian Marketplace.

Before setting up the wiki, determine each team's needs and wants for documentation. If a given task or requirement is not available in Confluence, install a plugin from the Atlassian Marketplace to resolve the request.
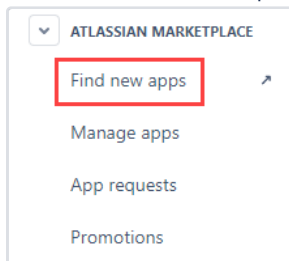

> 💡 Plugin pricing is based on the total number of Confluence licenses, not the number of people using the plugin. If ten users out of one hundred use the plugin on their pages, the price charged is for 100 hundred users.

Installing a Plugin

1. Click the cog wheel (⚙) in the top right corner. The **General Configuration** page displays.

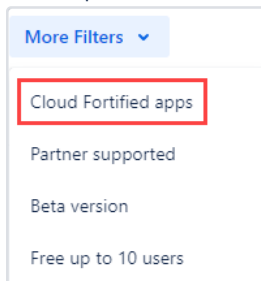

2. In the bottom left corner, expand **Atlassian Marketplace**.

3. Click **Find new apps**. A new window opens, displaying the Atlassian Marketplace.

4. Type one or two keywords and click **Enter**.

5. At the top of the search results, click **More Filters**.

6. Select **Cloud Fortified apps**. Plugins are made by 3rd-party vendors and selecting Cloud-fortified ones are a precautionary measure for security. Learn more.

7. Click and read through potential plugin descriptions.

8. To add a plugin to Confluence, click **Try it free**.

9. From the popup window, click **Start free trial**.

10. The bottom left corner displays a confirmation.

💡 Refer to the plugin page within the Atlassian Marketplace for further configuration. Setting up new plugins varies per vendor.
